

# REST API Instructions

All data is fetched from the REST API interface: <https://taitaja2025.hobbly.app/api/v1/>

The API documentation is available in OpenAPI format and includes information on all available endpoints.

The documentation can be found at: <https://taitaja2025-hobbly-api.apidocumentation.com/>

You will find two endpoints listed in the documentation:

## GET /posts

Displays all posts in paginated JSON format.

### Search Function

To use the search function, add the query parameter `?search=KEYWORD` to the URL. This way, `/posts` will return only the posts that match the given keyword.

### Pagination

The response from `/posts` includes information about the total number of pages and current page number. You can switch pages by adding the query parameter `?page=X`, where X is the page number.

## GET /posts/<id>

Displays the details of a single post. Replace `<id>` with an existing post ID, which can be found via the `GET /posts` endpoint. The details of a single post include additional information such as the contact person's details.

Make sure the URL is correct when fetching data (`/api/v1`).
